**Project Overview**

Rowan University invites proposals from qualified firms to provide the construction of pavement test strips in cold temperatures at CREATEs, in Mullica Hill, NJ.

**I. GENERAL OVERVIEW**

A. Rowan University’s Center for Research and Education in Advanced Transportation Engineering Systems (CREATEs) is collaborating with the U.S. Department of Defense/U.S. Army Engineer Research and Development Center (ERDC) to find solutions for various construction problems associated with cold regions. As part of this collaborative effort, CREATEs and ERDC have established a need to construct a set of pavement strips at the Rowan University Accelerated Pavement Testing Facility (RUAPTF), located in Rowan’s West Campus in Mullica Hill (South Jersey Technology Park, SJTP). The goal of this project is to construct full-scale pavement sections in cold temperatures to investigate the effect of construction temperatures on pavement density. Additional details are provided in the scope of work section.

B. **Project Goals**

1. The goal is to construct four full-scale pavement test strips in the winter season. Each pavement system strip will require placement and compaction of HMA at three different temperatures using a different compaction frequency. The Contractor will also assist the CREATEs team in the placement of thermocouples to record HMA temperature throughout the compaction process.

**II. SCOPE OF SERVICES**

The work required involves ten tasks as outlined below:

A. **Milling Existing HMA Pavement Section at CREATEs.**

1. All existing HMA pavement in the designated area should be milled and removed up to the specified depth. Approximate dimensions for excavated area are 70 ft. long by 15 ft. wide by 1.5 in. deep into the ground. The location of the area to be excavated is shown in Figure 1. The Contractor will be responsible for ensuring all existing pavement is removed and inspected by Rowan/CREATEs team prior to any further construction. Three pavement sections will then be built (labelled I, II, and III in Figure 1). The same process will be repeated on a subsequent day for each pavement strip that is constructed. The pavement will be milled to a depth of 3 in. deep on the subsequent day (this is different from the depth of the first milling process which is 1.5 inches). An overview of each test strip is provided in Figure 2 at the end of this document.

Figure 1: Location of excavation for cold compaction HMA full-scale sections.
2. Quality Assurance Operations
   a. The dimensions of the milled pavement strip will be evaluated by the CREATEs team (minimum five locations for width and length (across depth) and 42 locations for depth across both width and length).

3. Thickness Requirement
   a. If the average width or length are not within ±3 in. of the target values, or average depth is not within ±0.25 in. of target, or more than ten depth measurements are not within ±0.25 in. of target, the contractor must undertake corrective action, at their own cost, to ensure meeting these tolerances. Dimension measurements will be taken by CREATEs but the contractor is advised to measure pit dimensions before CREATEs to ensure meeting requirements.
   b. Similarly, to evaluate uniformity of thickness of the layer, CREATEs team will utilize a long level (12 ft. or 15 ft.) to measure the evenness of the layer across its length and width. A minimum of 20 locations (spaced 5 ft. apart across width and length) will be evaluated for levelness.

4. Leveling Requirements
   a. If five or more locations, in any direction, are not level (i.e. 1/8 in. over 15 ft.), the contractor must take corrective action and as many times as necessary, at their own cost, to ensure levelness of the layer.

B. Sensor Placement & Installation
   1. After milling and prior to paving, the contractor will work with the CREATEs team to assist in the placement and installation of thermocouples. Each sensor will be placed at the mid-depth of the new HMA layer as specified in Figure 2. Loose HMA mix will be placed and hand-compacted around each thermocouple to protect the sensor during construction. Care must be taken by the Contractor during compaction to avoid direct contact and/or damaging the sensors.

C. Placement and Compaction of Hot Mix Asphalt (HMA Layer)
   1. Once the milling is approved and sensors are installed, the contractor can then paver place and compact the HMA layer (target thicknesses dependent on test strips as shown in Figure 2). The Contractor must have the capabilities to prepare the HMA mixture or the ability to procure HMA mixture within the specified project schedule (not prior to January 15th or after February 29th). The Contractor must also work with CREATEs to select construction days that have similar weather conditions (ambient temperature within ±5 to 10oF, wind speed within ±5mph, etc.).
   2. One HMA mixture will be used throughout the project. There are also two buffer zones (as illustrated in Figure 2) to allow for transition to a different HMA mixture. The buffer zones must meet be level with surrounding pavement and meet density requirements outlined in the following sections. The specifications of the HMA mix are as follows:
      a. Asphalt Binder and Aggregate Gradation: PG 64-22 and 9.5 millimeter Nominal Maximum Aggregate Size. Table 1 presents the control points of the aggregate gradation required.
      b. Mix Design: Superpave mix design procedures must be employed to determine the optimum aggregate gradation and asphalt binder content for the unreinforced HMA mix. The design gyrations level is 75 gyrations. The mix at optimum binder content must meet the required minimum levels shown in Table 2.
3. During compaction, each test section must be compacted at a specific temperature. For the construction, the HMA should be placed and the compaction will begin when the HMA lift reaches the specified temperature. The Contractor will work the Rowan CREATEs team at the time of to determine when the compaction process should begin. The following breakdown shows the compaction temperatures of each test section.
   a. Test Section I: 250°F Compaction Temperature
   b. Test Section II: 215°F Compaction Temperature
   c. Test Section III: 180°F Compaction Temperature

4. The Contractor must also have the ability to compact HMA mixtures at different compaction frequencies using a vibratory roller compactor. The Contractor must provide Rowan CREATEs with the technical data and specifications on the compactor being used. The required vibratory compactor specifications for each test section are as follows:
   a. Test Strip 1 (1.5 in depth): High Frequency (3600-4000 vibrations per minute)
   b. Test Strip 2 (1.5 in depth): Low Frequency (1600-2400 vibrations per minute)
   c. Test Strip 3 (3.0 in depth): Low Frequency (1600-2400 vibrations per minute)
   d. Test Strip 4 (3.0 in depth): High Frequency (3600-4000 vibrations per minute)

5. As mentioned previously, a schematic of all test strips and test sections to be constructed as part of this contract are presented in Figure 2 at the end of this document.

6. **Density Measurement by Contractor**
   a. The Contractor must measure field density of compacted HMA layer using a NDG at 5 random locations, selected by CREATEs team, within each test section at the conclusion of compaction. The Contractor must also allow the Rowan CREATEs team to take density measurements after each compaction pass using the quick-reading compaction quality measurement device, PAVETRACKER. The Rowan CREATEs team will be responsible for providing the PAVETRACKER.

7. **Quality Assurance Operations**
   a. The contractor must provide CREATEs, at the time of construction, with a minimum of two 1-gallon cans of the asphalt binder used in preparing the HMA mix. CREATEs will utilize these samples, at a later day, to conduct PG grading testing and verify that the asphalt binder used is meeting PG 64-22 grading requirements. The binder must be sampled at the plant in the presence of a CREATEs representative from the tank used for producing HMA mix. If the binder does not meet grading requirements, the contractor, at their own cost and as many times as necessary, must replace the HMA layer placed.
   b. The contractor must also provide CREATEs with 10 five-gallon steel buckets of loose HMA mix for each HMA mixture used. The loose mix must be sampled at CREATEs from the truck using AASHTO T2 sampling procedures. CREATEs will utilize the loose mix to compact samples at 75 gyrations to ensure meeting volumetric requirements (Table 2). In addition, CREATEs team will conduct asphalt binder extraction and recovery procedures to ensure the actual binder content is within ±0.5% of reported optimum binder content (contractor’s Job Mix Formula, JMF which must be submitted to CREATEs).

8. **Gradation Requirements**
   a. Extracted aggregates will also be utilized to verify that the aggregate gradation of the mix is meeting the control points and is within ±2% on each sieve in comparison to the target aggregate gradation from contractor’s JMF. If these requirements are not met, the
contractor, at their own cost and as many times as necessary, must replace the HMA layer placed.

9. **Density Requirement**
   a. The target density of the HMA layer is within 2 to 8% (or 92 to 98% of Mix's Rice Specific Gravity, (Gmm)); however this density level may not be achievable when compacting at low temperatures. Therefore, the compaction process must continue until (i) the HMA layer reaches this target density range or (ii) the completion of 50 compactor roller passes, whichever occurs first.
